Education

Georgia Institute of Technology — Atlanta, GA
Master of Science in Computer Science (Machine Learning) — *Jan. 2024 – Dec. 2024*

Georgia Institute of Technology — Atlanta, GA
Bachelors of Science in Computer Science — *Aug. 2021 – Dec 2023*

Experience

DoorDash — June 2025 – March 2026
Software Engineer — *San Francisco, CA*

- Implemented the migration of DoorDash's order cancellation infrastructure for payments from a Kotlin-based platform to a Go-based system, successfully shifting 10% of production traffic to the new platform
- Spearheaded a cross-functional Caviar credits deprecation initiative by conducting SQL-based analysis across multiple data tables to identify and catalog all eligible credits, delivering actionable findings to the business team to drive a fully shipped deprecation

Amazon Web Services — May 2023 – Aug. 2023
Software Development Engineer Intern — *Seattle, WA*

- Created a code editor for developers to embed dashboards within AWS in order to test QuickSight as a product for their company
- Used React to create a standalone front-end page that allows users to run code
- Queried internal APIs with Java to create a URL for embedded dashboards

Amazon — May 2022 – Aug. 2022
Software Development Engineer Intern — *Seattle, WA*

- Migrated an internal customer service chatting tool to React.js that helped customer service representatives answer customer issues faster and more accurately.
- Used GraphQL to query a database for product images based on a customer's order and displayed images in an internal tool using React and TypeScript.
- Displayed translated product titles using GraphQL and React in over 18 different languages based on a customer service associate's marketplace.
- Wrote unit tests with Chai JS and increased code coverage by 20%.

REAN Foundation — May 2021 – Aug. 2021
Software Engineer Intern — *Leesburg, VA*

- Created a vaccination bot that interacts with users using Node.js, JavaScript, and Google DialogFlow to provide locations where they can get a COVID vaccine based on their current location
- Dynamically generated HTML tables that displayed every vaccination site in a user's district and sent them out using a bot on WhatsApp
- Filtered data based on vaccine type, doses available, and vaccination date based on user requests

Projects

NFL Trivia | *Python, React, DynamoDB, Redis, AWS*

- Architected a fully serverless real-time multiplayer game using event-driven microservices with API Gateway WebSockets, Lambda, DynamoDB single-table design, and ElastiCache Redis
- Built a GenAI question pipeline orchestrated by Step Functions, leveraging Amazon Bedrock foundation models and live ESPN API data
- Implemented low-latency leaderboard updates with Redis sorted sets, SQS distributed timers, and VPC private networking with interface endpoints

Agent Mafia | *Python*

- Built a 7 agent LLM system (LangGraph) that plays Mafia, where each agent runs a 3-stage **belief, reason, act** loop with persistent memory to reason, bluff, and vote autonomously over 30+ turn games
- Implemented per-call timeouts, retry-with-backoff, malformed-output recovery, and a cost-ceiling ledger over the Anthropic API capping full games at $0.20

Technical Skills

Languages: Java, Python, C/C++, SQL, JavaScript, TypeScript, HTML/CSS, Kotlin, Go
Frameworks: React, Node.js, Flask, JUnit, PyTorch, Material-UI, FastAPI, 3JS
Developer Tools: Git, Docker, AWS, VS Code, Visual Studio, PyCharm, IntelliJ, Eclipse
Libraries/Technologies: Pandas, Keras, NumPy, Matplotlib, gRPC
